

ZERO HUNGER

WHAT IS ZERO HUNGER?

"End hunger, achieve food security and improved nutrition and promote sustainable agriculture".

FACT AND TIPS ABOUT CURRENT PROGRESSION

We're wasting precious food. Nearly 690 million people worldwide are hungry – that's 8.9 per cent of the population, according to the latest UN study. In 2021 34 million people are teetering on the edge of famine and at risk of starvation.

5 THINGS YOU NEED TO KNOW ABOUT... ZERO HUNGER

- 1. We're wasting precious food*
- 2. Asia and Africa are hardest hit*
- 3. We also have an obesity crisis*
- 4. The issue is becoming more urgent*
- 5. We need to diversify our food supply*

HOW TO ARCHIVE ZERO HUNGER GOAL

www.zerohunger.com

FOC GROUP 10

SUSTAINABLE DEVELOPMENT GOALS

WHAT IS SDG ?

The Sustainable Development Goals (SDGs) focus on transforming our world. They are a call to action to end poverty and inequality, protect the planet and ensure that all the people enjoy health, justice, and prosperity.

The Sustainable Development Goals were born at the United Nations Conference on Sustainable Development in Rio de Janeiro in 2012. The Objective was to produce a set of universal goals that meet the urgent environmental, political, and economic challenges facing our world.

In 2015, the Sustainable Development Goals are collection of seventeen global goals aimed at improving the planet and the quality of human life around the world by the year 2030.

- **GOAL 1: No Poverty.**
- **GOAL 2: Zero Hunger.**
- **GOAL 3: Good Health and Well-being.**
- **GOAL 4: Quality Education.**
- **GOAL 5: Gender Equality.**
- **GOAL 6: Clean Water and Sanitation.**
- **GOAL 7: Affordable and Clean Energy.**
- **GOAL 8: Decent work and Economic Growth.**
- **GOAL 9: Industry, Innovation, and Infrastructure.**
- **GOAL 10: Reduce Inequality.**
- **GOAL 11: Sustainable Cities and Communities.**
- **GOAL 12: Responsible Consumption and Production.**
- **GOAL 13: Climate Action.**
- **GOAL 14: Life Below Water.**
- **GOAL 15: Life on Land.**
- **GOAL 16: Peace and Justice Strong Institutions.**
- **GOAL 17: Partnership to achieve the Goal.**

SDG 2 - Zero Hunger.

Zero hunger is a goal to end world hunger and malnutrition in 2030. It also aims to ensure that everyone has access to safe, nutritious, and sufficient food, as well as access to clean water and sanitation. It also includes promoting sustainable agriculture and addressing the root causes of hunger and malnutrition.

Zero hunger project has some goals and targets as follows,

Zero hunger is a goal to end world hunger and malnutrition in 2030. It also aims to ensure that everyone has access to safe, nutritious, and sufficient food, as well as access to clean water and sanitation. It also includes promoting sustainable agriculture and addressing the root causes of hunger and malnutrition.

1. By 2030, end hunger and ensure access by all people, the poor and people in vulnerable situations, including infants, to safe, nutritious, and sufficient food all year round.
2. By 2030, ensure sustainable food production systems and implement resilient agricultural practices that increase productivity and production, that help maintain ecosystems, which strengthen capacity for adaptation to climate change, extreme weather, drought, flooding, and other disasters and that progressively improve land and soil quality.
3. By 2030, double the agricultural productivity and incomes of small-scale food producers, in particular women, Indigenous peoples, family farmers, pastoralists and fishers including through secure and equal access to land, other productive resources and inputs, knowledge, financial services, markets and opportunities for value addition and non-farm employment.

As you can this project assure to the people that by 2030 hunger will be end and not a single human being will suffer without food or water. World hunger is one of the main problems in the world and this caused because of,

1. Conflict
2. Climate change
3. Gender inequality
4. Food waste

When considering the above factors, Conflicts are the main reasons for world hunger. Conflicts between countries hugely affect their economics and halts agricultural production also it ruins infrastructure too.

Do you know that around 345 million people were projected to be food-insecure in 2023. Warring parties may plunder an enemy's food supply, deliberately destroying farms, livestock and other civilian infrastructure to win while the losing country suffer to the highest. Conflict is the main driver of hunger in most of the world's food crises.

The Climate change, for agriculture climate is one of the main needs. Climate change is one of the biggest health threats facing humanity. Places where people can not grow or find sufficient food increases hunger and poor nutrition. Countries like Afghanistan, Bangladesh, Chad, Haiti etc... are suffering from climate change.

Gender inequality is the next title. In nearly two-thirds of countries around the world, women are more likely than men to suffer from hunger and malnourishment. That is because in many cases, women eat last and least. In many cultures, gender hierarchy is expressed through access to food. Often women have less access to food than men. This because of their practices supported by their economic dependence by beliefs that they need less and by pregnancy food taboos

Lastly food waste. This is a crime we all have been done but how? When we toss out food, we are throwing away precious resources that could have been used to feed hungry people. Globally one trillion dollars' worth of food goes to waste every year. That is one-third of all food produced for human consumption.

A family migrates from the Mogilla mountains to a community in Turkana, Kenya in search of food, water and medicine. Persistent drought has destroyed most of their livestock.
Photo: World Vision

Currently there is a brief idea about how much food get wasted for a year. Let us talk about how and why food gets wasted and the actions to prevent food waste. In industrial countries like Japan, America, Russia, China etc... 31% - 45% of food waste happens at retail and consumer levels. Think about all the food we toss out at home, what we leave on our plates at restaurants and what end up in grocery store trash bins. In developing countries like ours, most food loss happens during or after harvest time. Farmers face problems like,

- Poor storage
- Outdated technology
- Not enough workforce
- Transportation challenges getting crops to market.

Together these problems mean that too many small-scale farmers are forced to watch their crops and livelihoods rot in their own fields without even making a profit out of it.

To reduce the food waste, we can plan our meals and write a shopping list. And check your fridge to see what you have already got. This will help you avoid buying unnecessary food. And ask to buy the "ugly" fruits or veggies that get left behind at grocery stores. There are even companies that will help you get direct access to this kind of products, and it is often cheaper. It is a terrific way to save you food that you bought by using a freezer. Freezing is a great way to keep food longer. If you have more food than you can eat do not wait till it rot or can not be consume, give it to someone who needs it. For all good "sharing is caring."

Those are some ways to save yourself from a big crime, isn't it? You cannot stop a war, you cannot change climates for agriculture, but you can save food by being wasted.

Facts About World Hunger.

World hunger is worsening at an abnormal rate. The number of people who are suffering from chronic hunger has risen from 811 million in 2000 to 945 million in 2005, which is 11% of world population as of 2022. There are about 2 billion people that suffer from malnutrition and there are one in 9 people that don't have enough food to eat. Also, if we get 12 males there is a malnourished one boy or a man and if we get 5 females there is a one girl or a woman in worldwide

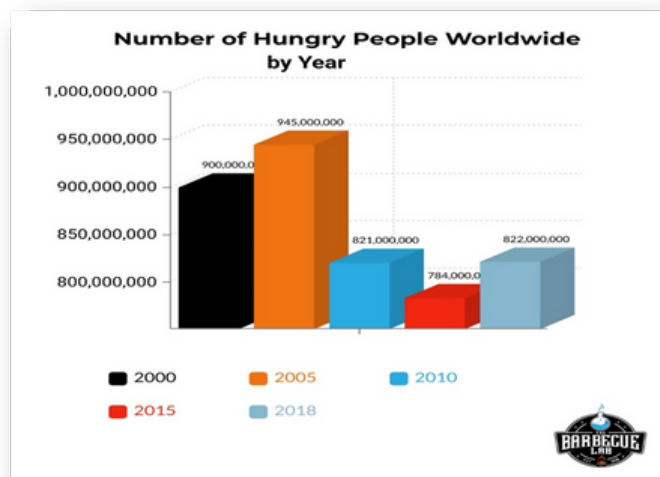

Figure 1 : Number of Hungry People worldwide by year

Approximately 50 million people across 45 countries are facing emergency hunger levels. This situation has gotten worsen to famine since last two years because of the global pandemic.

The United Nations' (UN) Hunger report defines hunger as "periods when populations are experiencing severe food insecurity." World hunger is caused when people spend their complete day with nothing to eat due to several reasons like lack of money and lack of access to food and other resources. Undernourishment is considered when a person is not able to consume calories above 1,800 per day.

According to UNICEF, they show that there are 15% newborns are born in underweight and because of malnutrition 161 million children that are age 5 are underdeveloped. These kind of children about three quarters are live in sub-Saharan Africa and South Asia. In each year overall 3.1 million under the age 5 children are died because of hunger and every 10 seconds a child dies from hunger.

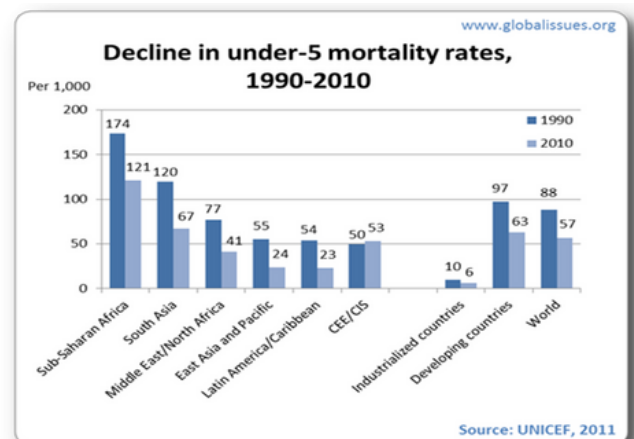

Figure 2 : Chart of worldwide Decline in under -5mortality rates 1990-2010

In developed countries there are also about 16 million people who are suffering from hunger. In 2019 ranked countries that were suffering from hunger and malnutrition are (out of 100points) ,

- The Central African Republic - 53.6
- Yemen - 45.9
- Chad - 44.2
- Madagascar - 41.5

There are eight countries where 2 to 3 people are suffering from hunger. Those countries are known as,

- Afghanistan
- Ethiopia
- Democratic Republic of Congo
- Yemen
- Nigeria
- Sudan
- South Sudan
- Syria

The countries whose hunger rates were largest increased are Swaziland (59%), Iraq (48%), Comoros (28%) and Burundi (11%). In 2019 the highest score of world hunger countries is the South Asia and Sub-Saharan Africa. The scores are 29.3 and 28.4.

Nearly 60% of the world's hungriest people live in conflict-affected areas

8/10 of the world's worst food crises are driven by war, persecution and conflict

80 million people were displaced from their homes by conflict in 2020

A vast majority of the world's hungry people live in countries and territories in conflict. The World Food Program (WFP) identifies conflict as the number one driver of hunger, with 60 per cent of the world's hungriest

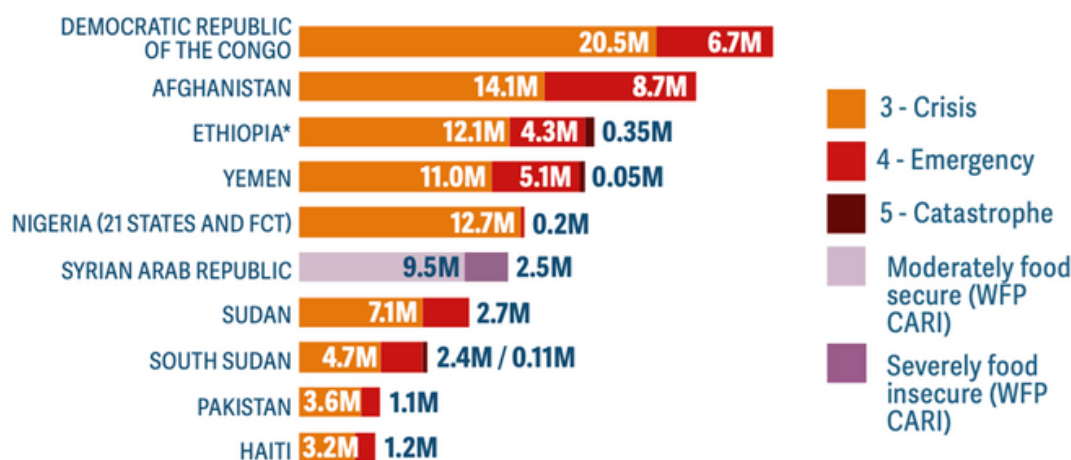

people living in conflict-affected areas. The worst food crises in the world are driven entirely by conflict, which is why nearly 80% percent of the U.N. World Food Program's budget is spent on conflict-affected countries.

About 10 per cent of the world population go to sleep hungry. While the world hunger rates have been on a decline in the past decade, the numbers started to grow again since year 2017. The reasons for this are climate change and natural disasters, conflict in several territories and the socio-economic effects of the COVID-19 pandemic. The ongoing war between Ukraine and Russia is another considerable reason too.

The Democratic Republic of the Congo has surpassed Yemen as the world's largest hunger crisis. Decades of civil war have left millions of dead or displaced. The number of severely hungry people skyrocketed from 13M in 2019 to over 26M in 2022 due to a toxic mix of conflict, displacement, disease, economic decline, natural disasters, and COVID-19. One in three Congolese – a record high – are now hungry.

FIGURE 1.13

Ten countries/territories with the highest number of people in Crisis or worse (IPC/CH Phase 3 or above) or equivalent in 2021

* These consolidated estimates combine two IPC analyses – the October 2020 analysis of Belg and Meher-dependent areas (covering January–June 2021) and the May 2021 update of conflict-affected areas of Tigray, Afar and Amhara (covering May–June 2021). The Government of Ethiopia has not endorsed the May 2021 analysis.

Source: FSIN, using IPC, CH and WFP data; GRFC 2022.

At this point, the UN has arrived in a conclusion that the world is not on track to achieve the Sustainable Development Goal of eradicating global hunger by 2030. In fact, if latest trends continue, the world could face 840 million people affected by hunger by 2030.

Wasted Food Statistics

In Worldwide every year overall 1.3 billion tons of food are wasted. Germans they throw 84% of food because of expired and other. reasons are 25% of buying too much food ,19% too large of product. packaging and 16% the product taste is not good. In Germany they throw 356 million kilograms per year. In Rich countries people are wasting 222million tons of food within a year. If we looked Sub-Sharan Africa in there the total food production is 230 million tons.

Poor nutrition holds responsible for the death of 5 million children under the age of five in 2020. According to a 2022 UNICEF report, 1 in every 5 deaths of children under age five globally is caused by severe wasting. A huge portion of the world's population is also affected by micronutrient deficiencies - a shortage of vitamins and minerals necessary to good health. This is sometimes called "hidden hunger," because there may not be obvious, visible signs of malnutrition. Iron deficiency in women of reproductive age is a prime example of a micronutrient deficiency.

The Food and Agriculture Organization (FAO) of the United Nations estimates that 17 per cent of or 1.3 billion tons of food available to consumers are wasted. This is on top of the 1.2 billion tons more of food that is lost on farms. At the same time, hunger kills more people every year than malaria, tuberculosis, and AIDS altogether.

But this is an injustice that we can fix in our lifetime - if done right, agriculture, forestry and fisheries can provide enough nutritious food for all.

Figure 3 : Global Food waste and losses per year

What Are The Main Causes Of Hunger In The World?

1. Poverty

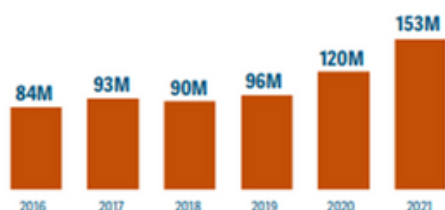

The annual emissions of greenhouse gases (GHG) equivalent to 3.3 billion tons of CO₂ from food waste are calculated. The entire water required to grow food each year that is lost or squandered (250km³) is equal to the Volga River's yearly flow in Russia or is three times the size of Lake Geneva.

The main cause of hunger around the world is poverty. The unequal income distribution and lack of resources in developing countries pave the path to extreme hunger. Millions of people cannot afford the land for farming or get supplies that they need for growing

2. Climate

Climate is another major cause for hunger. FAO identifies drought as the greatest single enemy of agricultural production loss, amounting to 82 per cent. In least developed countries and low to middle income economies, drought contributes to 34 per cent of crop and livestock production losses. Some of the countries and regions that are most vulnerable to the effects of climate change in agriculture include sub-Saharan Africa, Ethiopia, Ghana, the DRC, the Dominican Republic, as well as small island nations such as the Maldives.

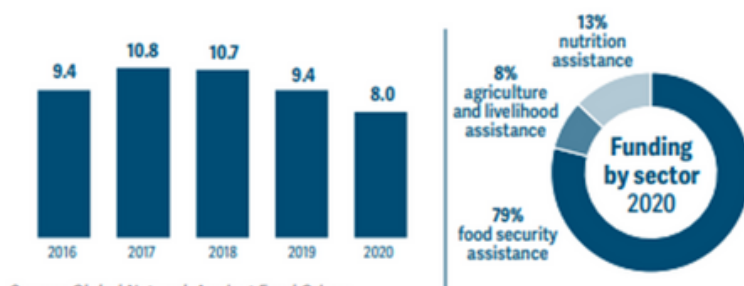

FIGURE 1.7

FIGURE 10

Disaster-induced production loss equivalent, expressed in average daily dietary energy supply per capita, 2008-2018

The above figure 10 shows how disaster-related production losses can translate into significant - and negative - nutritional outcomes including foregone calories and nutrients.

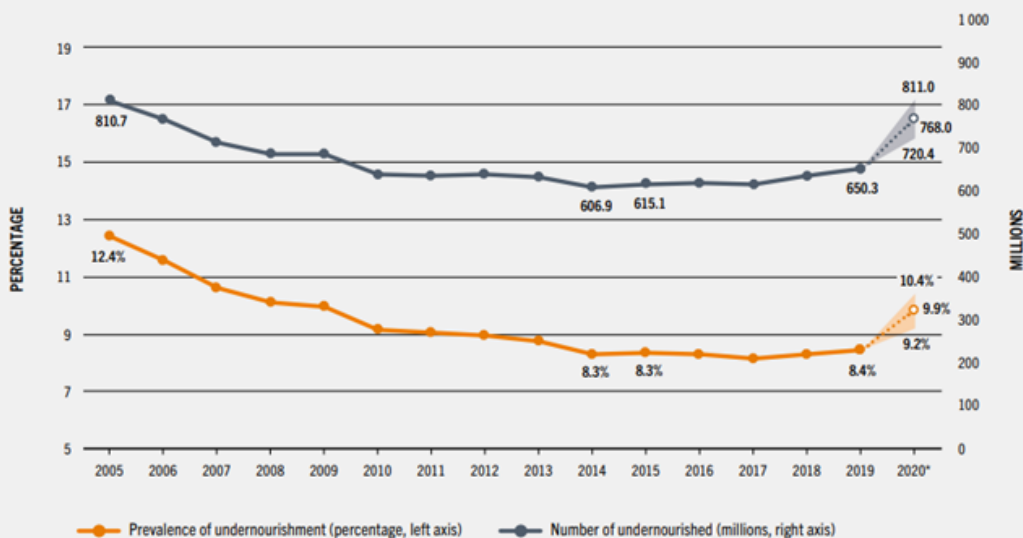

3. Conflict and Instability

The GRFC 2022(Global Report on Food Crises) highlights the dreadful levels of hunger worldwide, specifically the 193 million people affected by severe food insecurity across 53 countries and territories in crisis. Countries such as DRC, Ethiopia, Afghanistan, Yemen, Sudan, and Syria are examples for countries with prevailing wars and conflicts.

4. COVID-19 Pandemic

Before the covid-19 world is trying their best to archive the zero-hunger goal. Unfortunately, the process went down because of the covid-19. Word hunger and malnutrition levels became worst because of the pandemic, the amount of people who has lack of proper nutrition increased to almost 768 million last year after maintaining essentially study for five years. From this pandemic people discover the weaknesses in our food system, that threaten the people. The 2021 edition of "The state of food security and nutrition in the world" they are pointing out that sustainable development goal of zero hunger will be missed by a margin of nearly 660 million people.

FIGURE 1 THE NUMBER OF UNDERNOURISHED PEOPLE IN THE WORLD CONTINUED TO RISE IN 2020. BETWEEN 720 AND 811 MILLION PEOPLE IN THE WORLD FACED HUNGER IN 2020. CONSIDERING THE MIDDLE OF THE PROJECTED RANGE (768 MILLION), 118 MILLION MORE PEOPLE WERE FACING HUNGER IN 2020 THAN IN 2019 – OR AS MANY AS 161 MILLION, CONSIDERING THE UPPER BOUND OF THE RANGE

NOTES: * Projected values for 2020 in the figure are illustrated by dotted lines. Shaded areas show lower and upper bounds of the estimated range.
SOURCE: FAO.

The number of undernourished people in the world continued to rise in 2020. Image: FAO - The State of Food Security and Nutrition in the World Report 2022

2.73 billion people worldwide last year had year-round access to insufficient food up 320 million from the previous year. This increase is equivalent to the previous five years' growth put together. The UN believes that this will take years or decades to reversing such high levels of chronic hunger

The GRFC 2022 report also has stated that covid -19 pandemic was another driven reason for severe food crisis. Economic shocks like Inflation which brought by pandemic made food prices to rise, disrupted supply chains and uneven global economic recovery paved the path to rising global hunger.

FIGURE 1.16

Number of people in Crisis or worse (IPC/CH Phase 3 or above) or equivalent by primary driver, 2018–2021

	2018	2019	2020	2021
 Conflict/ insecurity	73.9M 21 countries	77.1M 22 countries	99.1M 23 countries	139.1M 24 countries
 Weather extremes	28.8M 26 countries	33.8M 25 countries	15.7M 15 countries	23.5M 8 countries
 Economic shocks	10.2M 6 countries	24.0M 8 countries	40.5M 17 countries	30.2M 21 countries

Note: Economic shocks include the indirect impact of COVID-19 in 2020 and 2021.

Source: FSIN, GRFC 2019–2022.

figure depicts the number of people in crisis as mentioned above in the main causes for world hunger.

The Way To Achieve Zero Hunger

The challenge of hunger is affecting millions worldwide and interrupting sustainable development. Eliminating hunger is not only an essential thing but also very important to achieve long-term sustainability. This article examines the ways that can we achieve zero hunger.

• Sustainable Agriculture

Promoting sustainable agricultural practices is a key component of achieving zero hunger. This is investing in research and development, adopting smart-climate techniques, and enhancing productivity while protecting the environment. Understanding agroecology, organic farming, and accuracy of agriculture can yield higher crop yields, reduce resource depletion, and minimize chemical usage. Using these methods, we can achieve zero hunger with a sustainable agriculture.

Farmers and World Vision staff discuss the progress of a large community cassava farm. Three years ago, World Vision began to build a bridge between relief and development in South Sudan. All projects in the area work in combination to achieve one goal: To improve the livelihood of the local population. Photo: World Vision.

• Empowering Smallholder Farmers

Supporting smallholder farmers, who state a significant part of global food producers, is paramount. We can provide them access to credit, training, and technology empowers to improve productivity, adopt sustainable practices, and gain better market access. To enhance their bargaining power and income we can do strengthening farmer cooperatives and promoting fair trade. Using these methods, we can achieve zero hunger with empowering smallholder farmers.

• Investment in Rural Infrastructure

To reduce post-harvest losses and ensuring efficient food distribution, investments in rural infrastructure, such as irrigation systems, transportation networks, and storage facilities, are crucial. Better infrastructure facilitates the movement of agricultural inputs, products, and knowledge, connecting farmers to markets and enabling fair income generation. Using these methods, we can achieve zero hunger by investing in rural infrastructure.

• Gender Empowerment

A world without hunger can only be attained by empowering women. Half of the world's population is made up of women, and they are crucial to nutrition, food security, and food production. But women frequently experience discrimination and lack access to the tools necessary to succeed as farmers and food product. For women and girls, this may result in starvation and malnutrition.

Women who are in control of their life and the lives of their families can make decisions. They have access to resources such as credit, land, education, and others. They can also participate in all decision-making processes, from the family to the global. This empowerment may lead to increased food production, improved nutrition, and a reduction in hunger.

According to the Food and Agriculture Organization of the United Nations, women make up 43% of the global agricultural labor force, with two out of every three women working in agriculture in poor countries. However, these women are not treated equally to males. They frequently face more severe poverty, have fewer educational opportunities, conflicting priorities, and control over land and resources. Females can , Women can be empowered in a variety of ways, including: facilitating access to training and education ensuring equal access to resources, including land and finance, encouraging women's involvement in decision-making addressing violence against women We can contribute to the development of a society in which everyone has access to adequate food to live a healthy and productive life by empowering women. How empowering women can help solve hunger: According to research conducted in India, women were able to boost crop yields by 20-30% when they had access to land. A program that gave women access to financing and training in Ethiopia assisted in cutting the number of hungry individuals by 12%. A program in Rwanda that encouraged women to participate in decision-making resulted in a 25% decrease in child mortality.

• Reducing food loss and waste

Food loss and waste are major environmental issues that affect the entire world. Approximately 14% of food produced for human consumption is thought to be lost between harvest and retail, whereas 17% of all food produced worldwide is thought to be wasted (11% in households, 5% in the food service industry, and 2% in retail).

causes of food waste include:

- Inadequate infrastructure and storage: There is often not enough infrastructure to adequately store food, which can result in loss or waste.
- Poor agricultural practices: If crops are not harvested at the proper time or are not kept properly, for instance, this might result in food being lost or squandered.
- Unrealistic food standards: Sometimes, food is thrown out because it does not adhere to certain criteria, such as when it is too big or too small.
- Consumer behavior: Consumer conduct, such as buying more food than necessary or improper food storage, can also result in food loss and waste.

There are a variety of reasons why it's crucial to reduce food loss and waste, including:

Benefits for the environment include a decrease in greenhouse gas emissions, water pollution, and land deterioration.

Economic benefits: Cutting down on food loss and waste can help conserve resources and money while also generating employment in the industry.

Benefits for society: Reducing food waste and loss will assist ensure that everyone has access to enough food as well as combat poverty.

Things you can do at home to cut down on food loss and waste include:

Take some time to plan your meals for the coming week before you go shopping. By doing this, you can both prevent overspending on food and ensure that you consume everything you do buy.

Verify expiration dates: To avoid wasting food, verify the expiration dates of the food before storing it. Proper food storage: To extend the life of your food, store it appropriately. For instance, bread should be kept in a cold, dry place and fruits and vegetables in the refrigerator.

Give food: Donate any surplus food to a nearby food bank or soup and kitchen.

29 September marks the day to raise awareness about food loss and waste. Even small changes in habits can make a big impact.

• Strengthening social protection

Several strategies to improve social protection and end hunger

To homes who are vulnerable and in need, give financial handouts. Given that it gives individuals the means to purchase food, this is among the most efficient strategies to eliminate hunger. Cash transfers can be universal, which means that everyone in a nation receives a transfer, or they can be targeted to particular groups, such as pregnant women, children, and the elderly.

Make safety nets for those who are sick or lose their jobs. These safety nets may consist of child care subsidies, disability benefits, and unemployment compensation. During trying times, they can assist individuals in maintaining their means of subsistence and access to food.

Invest in rural development and agriculture. This may aid in boosting food production and facilitating better access to food for the underprivileged and disadvantaged. Irrigation, crop diversification, and agricultural extension services are examples of investments in agriculture.

Encourage gender equality and social inclusion. This can make sure that everyone has the chance to access food and participate in the economy. Affirmative action initiatives, microlending, and girl-focused education are some examples of social inclusion interventions.

• Climate Resilience

Climate change a serious issue and has garnered much attention and utmost priority especially in agriculture connected to food and nutritional security for ensuring zero hunger. perhaps the geographical location of Sri Lanka's agriculture affects this. Here are some solutions to consider:

We can diversity agricultural practices such as droughts and floods, by promoting resilient farming systems. Enhance water management systems to ensure efficient farming systems. Use of synthetic chemical inputs can cause climate impacts, so encourage organic farming practices that reduce reliance on chemical inputs and promote soil health. Develop and strengthen early warning systems for extreme weather events, such as cyclones and floods. Improve post-harvest storage and processing because storage and processing infrastructure to reduce food loss and waste.

• Enhancing Market Access

Improving market access can reduce the impact of zero hunger in Sri Lanka.

Improving market access starts with improving the infrastructure needed by Sri Lankan agriculture. This includes investing in irrigation systems, farm to market roads and post harvest storage facilities. These improvements help farmers transport their produce to market more efficiently, reduce post harvest losses, and ensure food availability in the market. Empowering farmer organizations such as cooperatives and producer associations can improve market access for small scale farmers. . These organizations can collectively negotiate fairer prices, access credit facilities and improve their bargaining power with buyers. Other such solutions include developing value chains, providing farmers with accurate and timely information, and market information. Improvement of the system. Such strategies can improve Sri Lanka's market access.

Project that sri lanaka suggest to Achive zero hunger in Sri lanaka..

1. Food Production National Program
2. Implementation of Good Agricultural Practices.
3. Agricultural Research and Technology Development
4. Promoting sustainable agriculture through public-private partnerships.
5. Program to encourage production and use of organic fertilizers and "Sara Lanka Credit Scheme.
6. Crop Production and Forecasting Programme
7. Implementation of National Agricultural Research Plan with Universities (NARP)
8. Fruit Village Programme
9. Horticulture Promotion Programme.

Expected results

1. By adopting good agricultural practices, the country can be self-sufficient in food that can be produced locally and stop the foreign exchange spent on importing that food.
2. Producing healthy food for a healthy generation
3. Increasing crop production and productivity through mechanization and introduction of new technical agricultural methods.
4. Cultivation of fruits for domestic consumption.
5. Food security and higher nutrition in rural areas through crop diversification under the horticulture and fruit village programme.

80%

of Sri Lanka's land is in dry and intermediate zones which face frequent water shortages

15%

of children under 5 suffer from wasting

17%

of children under 5 are stunted
